1. Game Description

1.1 Elevator Pitch

An atmospheric difficulty increasing horror first-person shooter in which the player must escape a maze by first finding the keys to the exit and then surviving the path to the exit.

1.2 Summary

The game consists of having the player inside a randomly generated maze with very limited lighting. The atmosphere will be set mainly through sound where the player will constantly hear moans, steps, and scratching sounds 'coming from' the monsters within, which the player must either avoid or take out.

The player will have limited ammunition for self-defense which can will only increase from randomly placed pickups within the maze or from the keys needed to be collected in order to exit the maze and complete the level.

The game has high playability since the mazes are randomly generated, hence making the game increasingly challenging.

1.3 Unique Selling Points (USPs)

- The mazes are randomly generated which means players will theoretically obtain endless variations of the experience.
- The horror atmosphere will be conveyed by having sound be the most predominant way for the player to immerse themselves.
- Customizable experience. The player will be able to select how they wish to experience the game. They can make it extremely easy, lengthy or nerve wracking, through selection of preset maze sizes, starting ammo amount and/or enemy difficulty (health and speed).

2. Design

2.1 Key Mechanics

2.2 Characters and Settings

The game is set in the modern day. Earth is close to be decimated by a debilitating virus that has caused the infected to turn into zombie-like creatures. Dr. Alex Fleming, an army medical doctor is tasked with coming up with a cure, and he thinks he just needs one more ingredient, in order for the cure to be effective – the sweet-smelling herb Athelas.

The only problem, Athelas, is only known to be cultivated in one place in the world... a remote farm in the south of France, whose owner had the twisted idea of growing the lifesaving plant in the middle of a maze that he personally constructed, to keep it out of everyone's reach.

Dr. Fleming and his team travelled to the farm, and cautiously began to enter the maze to retrieve the Athelas, when they realized the farm has been overran with zombies! It's up to the player to help Dr. Fleming work his way through the maze, using the few weapons in his arsenal, and most importantly his wits, to survive and not only retrieve the Athelas, but make it out alive, and in time to save humanity!

3. Gameplay

3.1 Beginning the Game

The player is greeted by a dark screen with eerie music, where they have the options to play, read the instructions or customize various aspects of the game. It would be similar to the image below.

Figure 1: *Start Screen*

3.2 First 2-5 minutes

The player is placed at the entrance to the maze, a cut scene is displayed, explaining the lore and why the player is there. The player will have the option to continue the game with the default settings, or go to the 'Main Menu', where the game parameters can be changed to make the game more or less challenging.

From the initial scene, when the player selects 'Continue', the game begins. Initially the player has a flashlight that will flicker from time to time, giving the situation a sense of uncertainty and helplessness. Sound will be atmospheric, having muffled groans, scratching against walls, uneven footsteps and dragging across the floor, giving the player a sense that they are not alone in this maze.

The player will begin to move the character forwards, backwards and sideways, using the WASD or arrow keys on the keyboard and moving the camera using the mouse. Upon encountering the enemy or zombie, the player may choose to turn around, and find an alternate route or fight.

During the game, the player will have a certain amount of health which can be quantified like the 'Call of Duty', where the bloodier/redder the screen became as the health of the player declined.

The player will walk or run around, shooting or escaping from the enemies in tight corridors (help generate the common fear of claustrophobia) and will search for keys or items required to open the exit. The player may be able to find the exit but without the keys, they would not be able to win the game or complete the level.

The player will get a very dim sound prompt when they are within close proximity of a key and it would intensify or diminish, the closer they get. This 'hot/cold' mechanic can help relieve some of the frustrations a player may feel, thus making the game appealing to a broader audience while still retaining an unsettling feeling.

4.0 Visual Audio

4.1 Art Style

The art style will be a 3D polygon style which offers a timeless art style with colourful theme, making the game unique and convey a playful feel. The game will use 3D polygon assets by Synty as much as possible to provide a consistent art style throughout the entire game, including characters, items, building and the environment. Where a specific asset is unavailable, a custom model with texture will be made to resemble the art style as much as possible, for consistency.

Figure 2: *Polygon Adventure Pack (Campfire). Preview by Synty*

The gameplay style will be similar to POLYGON, and both are tactical first-person shooter genre. The game will feature responsive controls coupled with fast and fluid animation. The player can control the character to move, sprint, jump, crouch and shoot with polygon weapons to match the game's art style. The game will put heavy emphasis on gunplay with impactful shots at every bullet strike, shells ejecting from the gun, coupled with satisfying reload animations.

Figure 3: *POLYGON*

Figure 4: *World War Polygon*

4.2 Audio

On the start menu, the game will play an orchestral music to set the mood of the player to get ready to play, similar to polyfield. Once in the game, the music will change between two states depending on the player's activity. If the player has encountered an enemy, the music will get louder with a fast tempo, otherwise the music will be almost quiet with a mellow tone.

As for the environment, the sound will portray a feeling of an isolated scene. The game will rely heavily on atmospheric sound giving the player a sense of dread and 'stress' that there may be something right round the corner. Most of the sounds will play at random intervals so that the player may not find the audio cues predictable, but with random intervals to make them organic and not part of a predictable algorithm.

4.3 Front End

Upon starting the game, the player will be greeted with the start menu and a beautiful artwork in the background to invite the player to play the game. The menu UI will consist of a 'Start', 'Settings' and 'Exit' buttons. These buttons lead to a second menu page as shown in the wireframe below:

Figure 5: Start Menu Wireframe

The game will feature a simple HUD system with a slight transparency to allow the player to immerse themselves in the gameplay without being distracted by a complicated HUD. It consists of the health bar, ammo bar and weapon selection slots as shown in the illustration below:
